

## AVOIDING AIR HANDLER PROBLEMS

If you have not already done so, consider a simple modification to your air handler that will save you tons of grief. There is a drain pipe that comes out of one side of the unit to carry off the moisture that is squeezed out of the air as it is cooled. Add a T to this drain, as shown in the photo, and every 30 – 60 days pour in a half cup of Clorox to clear it of algae. If you don't, the drain will eventually clog; the condensate will overflow, your carpeting will be stained and smell of mildew, and your downstairs neighbor may become Very Angry!
